

Providers

GitHub

Version: v4

GitHub

GitHub returns a field on Account called refresh_token_expires_in which is a number. See their docs. Remember to add this field to your database schema, in case if you are using an Adapter.

Documentation

https://developer.github.com/apps/building-oauth-apps/authorizing-oauth-apps

Configuration

https://github.com/settings/apps

When creating a GitHub App, make sure to set the "Email addresses" account permission to read-only in order to access private email addresses on GitHub.

Options

The **GitHub Provider** comes with a set of default options:

• GitHub Provider options

You can override any of the options to suit your own use case.

Example

```
import GitHubProvider from "next-auth/providers/github";
...
providers: [
   GitHubProvider({
     clientId: process.env.GITHUB_ID,
     clientSecret: process.env.GITHUB_SECRET
   })
]
...
```

DANGER

Only allows one callback URL per Client ID / Client Secret.

Email address is always returned, even if the user doesn't have a public email address on their profile.
